# Basic Statistics for Machine Learning

You Could Call It "Statistical Learning"

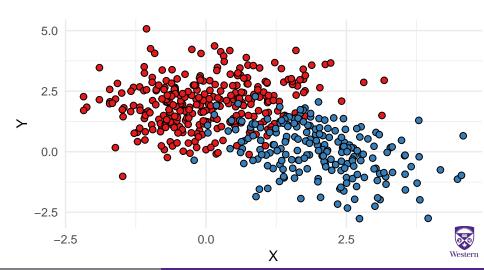

#### Demetri Pananos

### I Have A Problem

### I Have a Problem

#### How Can I Solve It?

- ▶ We can do this in a variety of ways.
- ► Some are very statistical. Some are very complicated.
- ► Some are in the middle. I'll call those *statistical learning* algorithms.

# Statistical Decision Theory

- ▶ The "Theorectically Optimal" way to do this would require knowing P(Is Red | X, Y).
- Maybe approximating this conditional distribution will be enough.
- ▶ But first, a little vocabularty

P.Pananos Stats for ML 2018-11-01 5 / 22

# Vocabulary

Marginal

P(X)

Joint

P(X, Y)

Conditional

P(X|Y)

# **Probability**

Sum Rule

$$P(X) = \sum_{Y} P(X, Y)$$

Product/Chain Rule

$$P(X, Y) = P(Y|X)P(X) \stackrel{or}{=} P(X|Y)P(Y)$$

D.Pananos Stats for ML 2018-11-01

# **Probability**

We can recover some very powerful rules just from these. For example, Bayes' Rule

$$P(Y|X) = \frac{P(X|Y)P(Y)}{\sum_{Y} P(X|Y)P(Y)}$$

D.Pananos Stats for ML 2018-11-01 8 / 22

# Naive Bayes

Use Bayes' Theorem to compute P(Is Red | X, Y).

 $P(\operatorname{Is} \operatorname{Red}|X, Y) \propto P(\operatorname{Is} \operatorname{Red})P(X, Y|\operatorname{Is} \operatorname{Red})$ 

D.Pananos Stats for ML 2018-11-01 9 / 22

# Naive Bayes

P(Is Red) = The proportion of our sample which belongs to Red

P(X, Y | Is Red) = Distribution of data belonging to Red

10/22

Pananos Stats for ML 2018-11-01

#### The Naive Part

The Naive Part of Naive Bayes

 $P(X, Y | S Red) \propto P(X | S Red) P(Y | S Red)$ 

11/22

Stats for ML 2018-11-01

#### All in All

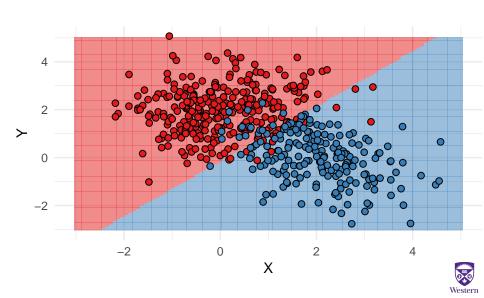

P(Is Red | X, Y) = P(Is Red)P(X|Is Red)P(Y|Is Red)

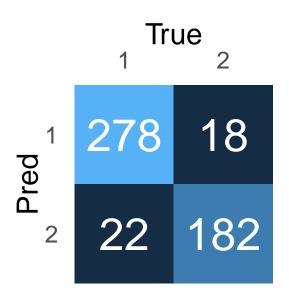

Make another assumption that P(X|Is Red) is normal.

### Quadratic Discriminant Analysis

Naive Bayes ignores the covariance between data by assuming independence between covariates.

Quadratic Discriminant Analysis will use some information about covariance to help make predictions. In order to fit these models, we need to understand

- ightharpoonup Expectation in  $\mathbb{R}^n$
- ► Covariance Matrices

15/22

D.Pananos Stats for ML 2018-11-01

#### Means and Covariance

- ► Expectations in multiple dimenions behave like expectations in a single variable.
- ▶ If X is an n-dimensional random variable with expectation  $\mu$ , then

$$E[X] = \mu = \begin{bmatrix} \mu_1 \\ \mu_2 \\ \vdots \\ \mu_n \end{bmatrix} \approx \begin{bmatrix} \sum_k \frac{x_{1k}}{N} \\ \vdots \\ \sum_k \frac{x_{nk}}{N} \end{bmatrix}$$

D.Pananos Stats for ML 2018-11-01 16 / 22

#### Means and Covariance

If X is an n-dimensional random variable with covariance matrix Σ, then

$$\Sigma_{ij} = \mathsf{Cov}(X_i, X_j)$$

▶ This implies  $\Sigma^T = \Sigma$  since the covariance is a symmetric operator.

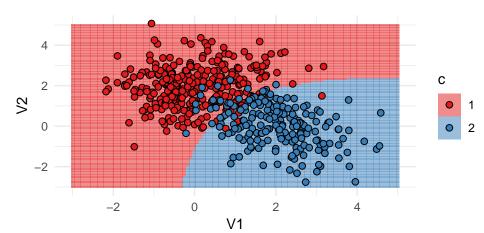

D.Pananos Stats for ML 2018-11-01 17 / 22

# Back To Quadratic Discriminant Analysis

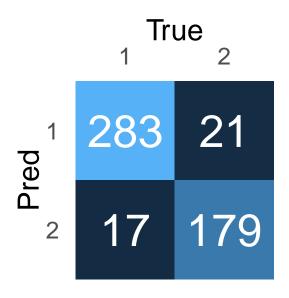

- Assume that  $X|C_k \sim \mathcal{N}(\mu_k, \Sigma_k)$ . That is, assume that the two classes have different covariance and different means.
- ightharpoonup Compute  $P(C = C_k | X)$  using Baye's rule.
